

2018 Carinthia University Study Tour

History of Collaboration
and
Student Contribution

Elizabeth Dubois MSc FRSPH MFPH
Imperial College London
21 February 2018

Introduction

Elizabeth Dubois MSc FRSPH MFPH

Background: *clinical, economics, public health specialist*

Professional: *finance, health policy, nursing, education, training, workforce*

Experience: *hospital sector, public sector, international, government, academia, research*

Since 2005, Salman and I have been host to interested students from [Austria's Carinthia University](#) of Applied Sciences coming to London for short-term internships in Public Health.

Aimed at strengthening the role of public health through practical experience, students are linked to community projects which focus on health promotion or health prevention.

Whilst working, students are fully engaged in data collection and analysis and are responsible for presenting their findings on the impact of population-based health care.

Introduction

- Vaccination is an essential part of UK health policy protecting the population against infectious diseases, and is pertinent to Government pronouncements around public health.
- In 2002, the Department of Health (DH) published its blueprint document “Getting Ahead of the Curve – A strategy for combating infectious diseases” (CAOTC) highlighting the enormous gains safe and effective vaccines confer on health – particularly eradication of disease – whilst focusing on R&D of future vaccines.¹
- Eight years on, it is important to evaluate the “New Vaccines” section of CAOTC to assess progress against projected milestones; analyse policy developments; and consider future areas of focus.

Methods

- A critical appraisal of original milestones versus subsequent developments was undertaken involving a retrospective review of CAOTC focusing on four areas: 1) technology & science; 2) international comparisons; 3) economics; and 4) media & public perceptions.
- A review of the current UK schedule versus international counterparts was performed. A comparison of the 2002 vaccination programme versus the current programme was undertaken to evaluate progress and opportunities.
- A structured literature review (Embase & PubMed) was performed to identify relevant published sources.

Results

- Technology & science**
 - The UK immunisation schedule has seen the number of vaccines increase since 2002 (Figure 1).

Figure 1: Advances in UK Immunisation Schedule

- Acellular pertussis vaccine introduced in 2004
- Inactivated polio vaccine replaced live oral polio in 2004
- Childhood pneumococcal conjugate vaccine added from 2006, followed by a change from 7 to 13 valent in 2010
- MMa catch-up programme for 5-16 year olds
- HPV vaccine introduced in 2008 for 12-13 year old girls with catch-up to 18 years
- Extended use of influenza/pneumococcal vaccines to a wider group phased in since 2003

- Advances were largely consistent with predicted short-term developments highlighted in CAOTC, including development of a rotavirus vaccine, in contrast to 10-year R&D breakthrough projections where vaccines against HIV, HSV and Malaria are still in development.
- Since 2002, the pace of emerging vaccines is noteworthy. It is anticipated that many new and improved vaccines in development are expected to be approved in the short-term.
- Technological advances continue to deliver improvements in new combinations, delivery mechanisms (e.g. oral, intradermal) and adjuvants.

2) International comparisons & World Health Organisation (WHO)

- There are many reasons why countries are not meeting immunisation needs but three particular factors seem to act as barriers to success – 1) vaccination systems, 2) perception of vaccines, and 3) political will.²
- With these factors in mind, a simple comparison of UK and international schedules highlights differences in global vaccination policy, and indicates that the UK arguably lags “behind the curve” of many other developed countries, most notably in the wider use of vaccines against varicella and rubella (as used in the US and Australia).

- The WHO together with international partners has been proactive in global strategies promoting affordable use of vaccines like hepatitis B and *Haemophilus influenzae* B. They have also led research on rapid development of new vaccines yet member states continue to face epidemiological, financial and ethical challenges. Where possible, the UK should further utilise WHO expertise.³

3) Economic outlook

- In 2002, the UK economic backdrop for CAOTC was very different, with a deficit of around £7bn in contrast to the current deficit of over £160bn. Future policy must be aligned with economic imperatives.
- Critically, policy must be synchronised with Government commitments to shift the NHS from curative to preventative healthcare strongly emphasising public health; something central to the NHS’ affordability and sustainability.
- Vaccination is preventative conferring high economic and social value through avoidance of illness and disease. It is also a quality of life enhancing intervention helping control epidemiological outbreaks and trends.
- To “get ahead of the curve”, it is arguable that investment in vaccination should incrementally increase to generate savings avoiding opportunity costs from curative resource burdens. Future policy should be harmonised with public health imperatives advancing the “invest to save” philosophy.

4) Media & public perceptions

- A perennial problem informing policy is media and public misperceptions; a consequence of poor education and lack of clear information. There is a need to highlight the health improvements of targeted immunisation, especially amongst disadvantaged communities.
- Although some improvements have been made following the MMR scandal, since 2002, in general there has been limited progress in dispelling popular vaccination myths. As Box A shows, misplaced media equilibrium has been unhelpful.

Box A – Examples of Media Headlines

- Professional attitudes show the extent of the problem, e.g. seasonal influenza vaccine uptake has historically been low amongst health workers.
- A key focus for future policy must be education and a proactive approach to ensuring media and public misperceptions do not undermine public health.

Conclusions

- Our research shows the need for a “new vision” for UK vaccination policy including greater understanding of preventative healthcare and the benefits of vaccination for controlling infectious diseases and improving quality of life.
- To “get ahead of the curve”, vaccination investment should incrementally increase. This is central to generating future savings and avoiding opportunity costs from curative interventions – an imperative for an affordable and sustainable NHS.
- For vaccination policy to optimally contribute to public health protection, improvements in education and information dissemination are required to change media and public perceptions and dispel popular myths.

New app helps sickle cell anaemia patients keep medical records

By Deborah Clarke
12 February 2015

Researchers at Imperial College London have designed a new app to help sickle cell anaemia patients keep track of their condition.

Sickle cell anaemia (SCA) is a hereditary blood disorder. It is caused by a change in the shape of red blood cells, which are the cells that carry oxygen around the body. The change makes the cells sticky, so they can clump together and block blood flow. This can cause pain, fatigue, and other health problems. Patients often have to keep a record of their symptoms and treatments, but this can be difficult to do.

The new app, called Sickle Cell History, allows patients to record their symptoms, treatments, and test results. It also provides information about the condition and how to manage it. The app is available for free on the App Store and Google Play.

Dr. Jackie Hackett, who led the team that developed the app, says: "We think this app will be a real help to patients. It will allow them to keep a record of their condition in a way that is easy and convenient. It will also give them access to information that they need to know about their condition and how to manage it."

The app was developed by a team of researchers from Imperial College London, including Dr. Jackie Hackett, Dr. David Gladwin, and Dr. David Gladwin. It was funded by the Wellcome Trust and the Medical Research Council.

RELATED NEWS

- SCA should also be used in developing countries, where sickle cell anaemia is more prevalent. "This app is available globally right now, so anyone who has an interest could pick it up and use it," Dr. Hackett adds. "We think this app will be a real help to patients. It will allow them to keep a record of their condition in a way that is easy and convenient. It will also give them access to information that they need to know about their condition and how to manage it."

Faculty of Medicine

Tremorererkennung über einen Schreibstift

Studienbereich Medizintechnik/Medizintechnische Systeme

Tibor Zajki-Zechmeister (tibor.zajki-zechmeister@edu.fh-kaernten.at)

Inhalt

- Messung des symptomatischen Tremors der Parkinson-Krankheit
- Alternative zu teuren oder inakzeptierten Diagnoseverfahren
- Aufzeichnung des manuellen Tremors über elektrische Signale, die mittels Software bearbeitet und visualisiert werden können
- Amplitude, Frequenz und Zeitverlauf ermöglichen Mediziner die Diagnose, ob der Tremor natürlich oder eine Anomalie ist
- System dient zur Kurzdagnostik, präventive Diagnose und zur Beurteilung von pharmakologischen Behandlungen gegen den Tremor
- Patienten müssen nur einen Stift in Aufrechterhaltung halten, es sind keine Komponenten am Körper zu befestigen

Funktionsweise

- Patienten nehmen Stiftsensor in die Hand und legen die Sensorelektrode auf einen stabilen Gegenstand (Tisch etc.)
- Der piezoelektrische Drucksensor erfasst Druckänderungen, die durch einen Tremor verursacht werden können, und wandelt sie
- Die Änderungen werden in Form von kapazitiven Änderungen des Sensors gemessen und beeinflussen die Verstärkerschaltung, in welche der Sensor als Ausgangsintegriert ist
- Die Schaltung wandelt die analogen Signaländerungen in digitale Zustände von „1“ und „0“ um. Die Druckänderung wird nun als Periodendauer der Signale ausgegeben
- Über eine serielle Schnittstelle werden die digitalen Signale mittels eines Mikrocontrollers an die Software geschickt, die eine Verarbeitung der Signale durchführt
- Die verarbeiteten Signale werden in Form einer Kennlinie ausgegeben

Abstract

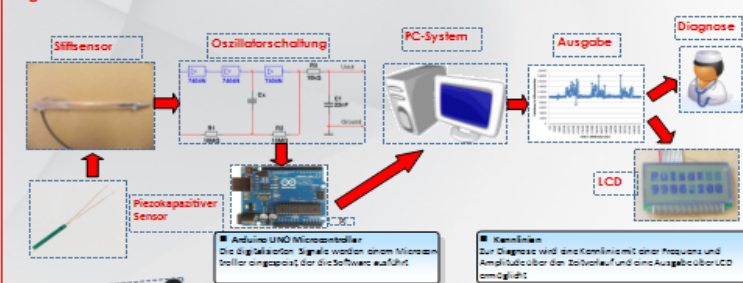

Die Parkinson-Erkrankung betrifft weltweit mehrere Millionen Menschen. Die neurodegenerative Krankheit verursacht diverse Symptome wie gestörte Instabilität oder einen nicht kontrollierten Tremor. Die heutigen Diagnoseverfahren können die Parkinson-Erkrankung zwar diagnostizieren, jedoch sind sie invasiv oder haben diese Arbeit inakzeptabel teuer. Tremoren treten in Form von, welcher den symptomatischen Tremor elektrisch erfassen und die Ergebnisse mittels Software visualisieren kann. Die Messungen zeigen, dass das verwendete Prinzip eine piezoelektrischen Drucksensors den Tremor erfassen und auch weiterleiten kann. Die verarbeiteten Ergebnisse zeigen eindeutige Tremoren, die bei der Symptomatik einfallen können und differenzieren diese von dem normalen manuellen Tremor, welcher nicht pathologisch ist.

Prinzip

- Piezoelektrische Sensoren reagieren auf Druckänderungen in die langstuhlmehrmalung in Form von Spannungsänderungen
- Im Stiftsensor wird ein piezoelektrischer Sensor verwendet, welcher bei Druckänderung den Kapazitätswert des Stifts verändert

Ergebnis

- World Health Organization Public Health Aspects of Non-Communicable Disease Seminar - London
- Quality Outcomes Framework in Primary Care
